- **Summary:**

Due to bug in 000Webhost, the database inside the 000Webhost is only connected to the website yet it is not fetching any data starting from the login page. However, on our first try of using the 000Webhost database with the website, the website was working perfectly fine and it was fetching and posting data to and from the website. We have tried to use 3 different emails to host our website yet it still contains the same bug. Nonetheless, our 'bookingccse.zip' file works perfectly fine with the localhost database.
